

IN THE CLAIMS

Cancel Claims 1-22 and 24 and add the following claims:

~~25. (New) A set of elements used to set up light display~~

furniture for at least one display element comprising:

- lower and upper hooking devices between which the at least one display element is to be held;
- a ground support device;
- a base attached to the lower hooking device;
- a flexible structure item being adapted to form an elevation structure having a first end attached to the base;
- a fixing device adapted to receive a second end of the flexible structure item;
- the base having no more than one support area, with a substantially elongate shape in a side direction for the ground support device;
- the lower hooking device having the ground support device arranged to rest on the ground being spaced apart from each other, in a cross direction such as to support the base; and the flexible structure item having the lower and upper hooking devices attached to opposite ends thereof, and wherein the lower and upper hooking devices have length adjusting means

~~for adapting to different width display elements and wherein the base has means for attaching the first end of the flexible structure item of various lengths at various locations on the base to permit adapting the elevational structure to a length of the at least one display element.~~

26. (New) The set according to Claim 25, wherein the ground support device of the base and the support devices of the lower hooking device are quadrilateral in shape.

27. (New) The set according to Claim 25, wherein the ground support device of the lower hooking device includes at least one part which can be slideably attached having a round shape perpendicular to a cross direction.

28. (New) The set according to Claim 25, wherein the lower and the upper hooking devices have at least one rod-shaped item having an elevation concavity adapted for placement across the respective hooking device and attachment to the at least one display element.

29. (New) The set according to Claim 28, wherein the at least one

rod-shaped item is a carbon fibre tube with a uniform cross-section.

30. (New) The set according to Claim 28, further comprising an intermediate binding item arranged for attachment to the at least one display element, the intermediate binding item having a side open section, in the cross direction, the set further comprising a first holding device for the at least one display element and a second holding device arranged to receive the rod-shaped item.

31. (New) The set according to Claim 30, wherein the first holding device is adhesively joined to the at least one display element.

32. (New) The set according to Claim 30, wherein the first holding device has a slit and the intermediate binding item has edges which protrude towards the slit along a side facing one another and opposite the second holding device with the slit stretching across an edge of the intermediate binding item, the second binding item being arranged to join the first holding device to the at least one display element.

33. (New) A set according to Claim 28, wherein the lower hooking device further includes support devices with the support devices being located at each end of the rod-shaped item.

34. (New) A set according to Claim 25, wherein the base has two parallel pieces, which are substantially longitudinally lined up on either side of the fixing devices of the flexible structure item, each parallel piece having a lower linking device for the lower hooking device.

35. (New) A set according to Claim 28, wherein the lower linking device of the base is hook-shaped and adapted to join the rod-shaped item, with an elevation concavity pointed towards the ground support device of the base.

36. (New) A set according to Claim 25, wherein the fixing device of the base further includes several section cases which are substantially in a side direction with each of the section cases having a section which is substantially complementary to a predetermined lower end of a predetermined flexible structure item.

37. (New) A set according to Claim 36, wherein the section cases are substantially in line across the side direction and have

decreasing areas as they extend towards the lower linking device.

38. (New) A set according to Claim 25, wherein the flexible structure item forms a substantially linear elevation structure.

39. (New) A set according to Claim 25, wherein the flexible structure item forms an elevation structure that contains several flexible structure items which form at least one substantially flat-cone shaped cane, and at least one of the several flexible structure items being a tube of carbon fibre.

40. (New) A set according to Claim 39, wherein a lower end of the elevation structure has a larger area than an upper end.

41. (New) A set according to Claim 39, further comprising an assembling device at the lower end of the tube, having a section and a second tube, with the section of the tube protruding towards the second tube and an upper end of the tube length having a case of cylindrical shape adapted to receive the section.

42. (New) A set according to Claim 25, wherein the upper linking device is adapted to receive the upper hooking device and a

second fixing device at an upper end of the elevational structure.

43. (New) A set according to Claim 42, characterised in that the fixing device has at least one notch, adapted to join with the hooking device.

44. (New) A set according to Claim 42, wherein the second fixing device has an open case which is pointed towards the base, being adapted to attach the second fixing device to the upper end of the elevational structure.

45. (New) Light furniture for a display element, comprising a combined display element which is assembled into a set of units having:

- lower and upper hooking devices between which the display element is to be held;
- a ground support device;
- a base attached to the lower hooking device;
- a flexible structure item being adapted to form an elevation structure having a first end attached to the base;
- a fixing device adapted to receive a second end of the flexible structure item;

- the base having no more than one support area, with a substantially elongate shape in a side direction from the ground support device;

- the lower hooking device having the ground support device arranged to rest on the ground being spaced apart from each other, in a cross direction such as to support the base; and the flexible structure item having the lower and upper hooking devices attached to opposite ends thereof, and wherein the lower and upper hooking devices have a length adjusting means for adapting to different width display elements and wherein the base has means for attaching the first end of the flexible structure items of various lengths at various locations on the base to permit adapting the structure to different length display elements.

46. (New) Furniture according to Claim 45, having a poster as a display element and having a flexible panel of envelopes with cellulose-type material.

47. (New) A packaging set according to Claim 45, wherein the container is formed of cardboard.
